Dear Stefano Tavani,

I have read the 2 formal, anonymous reviews on your submitted manuscript, as well as your reply to both reviews. From this I conclude that both reviewers agree that this manuscript requires a significant amount of work before it would be acceptable for publication, and therefore I consider this as a major revision. I find both reviews very useful with a lot of good suggestions to improve the manuscript. As both reviewers point out, the manuscript needs considerable revision to make it easier to understand. I strongly suggest to pay special attention to structuring the manuscript and keeping it

C158

concise and clear.

Please also keep in mind the context of this special issue on Subduction Zones, and adapt, where possible, the text so that it becomes understandable for the general audience of this special issue. In this respect, I'd like to add to this that it would be useful to also emphasize more and highlight where possible the relevance of this work to a subduction setting.

I look forward to receiving your revised manuscript that is more structured, shortened and clarified where possible, and with the issues, raised by the reviewers, addressed.

Once again thank you for submitting your work to this special issue of Solid Earth.

Best regards,

Jeroen van Hunen
