Received and published: 2 September 2012

Dear Authors,

thanks a lot for your detailed reply to the reviews of your manuscript. Your work represents an interesting technical contribution for setting future models focused on the study of regional slab geometry/kinematics/dynamics and, for this reason, it is of interest to our special SE issue on subduction zones.

The two referees gave constructive suggestions to improve the quality of your original manuscript. Despite the additional tests proposed by the referees would have enlarged the applicability field of your results, I think that the revised version of the manuscript can be now submitted.
