Thank you for your interest and your contribution in the discussion. In the lab work you can control the variables, it is true, but one part of these samples coming to the forest fire conditions. The ashes some times are mixed with the soil and it change the conditions, it is true and I know these problemes. But with these experiment I try to get more information of the behavior of the gypseous soils after the forest fires in a shrub area. By this, I use these temperatures and the problemes with perturbations by ashes is less, here.
