Dear Søren,

In the light of the comments made by the reviewers, I have carefully edited your manuscript “Review of some significant claimed irregularities in Scandinavian postglacial uplift in time scales from tens to thousands of years: earthquakes?” submitted for eventual publication in Solid Earth.

Both Hilmar Bungum and Reviewer 2 agree on the relevance of the Ms and the scien-

C740

tific quality of the work presented. However, the two reviewers also suggest implementation of a number of minor to moderate points in order to improve the paper. I have in addition a few minor comments (see below).

Before final acceptance of the paper, I would require a revised version of the Ms according to the criticisms previously raised and formal point-to-point answers to the reviewers' comments.

Best regards

C. Pascal

Specific comments: P1616, L3: I agree with Reviewer 2 the two sentences should be merged. P1619, L16: one should read “Olesen et al., 2004” P1625, L15-22: This paragraph appears to belong to the following section (“Claim 4”) I particularly agree with comment (8) from H. Bungum stating that other local stress sources are driving the neotectonic activity of Fennoscandia. In particular I invite you to check the modelling study of Pascal and Cloetingh (2009). Also, as pointed out by H. Bungum the relative “regularity” of the uplift pattern needs to be discussed.
