Received and published: 4 January 2016

Dear editor, The paper se-2015-102 Soil contaminations in landfill: a case study of the landfill in Czech Republic by D. Adamcová, M.D. Vaverková, S. Bartoň, Z. Havlíček, and E. Břoušková is a good contribution about an interesting topic related to an environmental issue in Europe. How the landfills are polluting our soils and changing the chemistry of the Earth Crust surface: the soil system.

I suggest publication, although I will recommend the authors to review the paper in the following way. The paper needs an general introduction about the soils in the Earth System and how important they are . . . and to show some literature update Something like:

Discussion Paper

Soil is the key part of the Earth System as it control the hydrological, erosional, biological and geochemical cycles. Soil System is also offering goods, services and resources to the humankind (citations 1). This is why it is necessary to research how the soils are affected by the use by the human societies. Pollution is one of those damaging human activities and we need more information and assessment of the land pollution (citations 2).
