Received and published: 22 June 2015

**OVERALL COMMENTS** This manuscript presents interesting ideas about the application of USLE in areas where the impact of human activities might be important. Although it is not well-developed (please, in Table 8, all the abbreviations have to be explained and a flow diagram is essential to explain the iterations and subroutines programmed), there are some very interesting concepts. I suggest that the authors highlight how this approach can be used in other places where data are available whereas I am not sure about the usefulness of the application in one catchment only without real measurements. Therefore, my recommendation is Major Revision. The main weaknesses are related with:

1. There are not measurements to evaluate its usefulness. The authors must be aware that the justification to consider appropriate rates of erosion is really poor. Please, the

use of “past references” is not nice at all. You have to provide all the details and to mention why the parameters are used or not. I was wondering because the results from GIS are so reliable (e.g. lines 1-5, page 1740).

2. On the other hand, in agricultural areas, C varies along the year (please, remember the different subfactors of C). The catchments are mainly forest, however, is the effect of soil moisture important? You must discuss this aspect.

3. Finally, the other important aspect to improve is the readability. The structure can be improved. A flow diagram is needed to clarify the different stages and the comparison of the USLE values in the catchments. The equations must be developed with the abbreviations and the units. The Introduction is very generic and I was wondering what type of innovations have been included in USLE recently. Please review the structure of Material and Method because it is difficult to follow (2.2 Data from GIS and past references; 2.3 Data obtained for the USLE; 2.4 Data analysis). You compared different parameterizations why?. In 2.4., I think you must explain the approach with the equations. The number of Tables must be reduced (some of them can be joined).

DETAILED COMMENTS 4. Introduction – see comment 3. It is too generic. Why did you describe the last innovations of USLE?

5. Material and Method – Please review this paragraph. You have to be more accurate. You did not measure anything so you have to justify why you used the values of the Tables.

“All data for this study, such as topographic features, were obtained from GIS; the effects of the physical and socio-economic factors used to determine the USLE coefficient were obtained from the past references (Doand Güçer, 1976; Arnoldus, 1977; Balç, 1996; Cebel et al., 2013).” See overall comment 3, too.

6. Results and discussion. Please, review the number, I’m afraid the units of the values are not correct or it does not make sense at all (lines 9-10 , page 1471).

7. Conclusions (see overall comments).

8. Tables 2 and 3 can be joined (as well as 4-5 and 6-7). The abbreviations have to be explained (particularly in Table 8). Please, remove “past references” and to provide the accurate reference. If you include a flow diagram, you can mention the values of Tables.
