Interactive comment on "Soil wind erosion in ecological olive trees in the Tabernas desert (S.E. Spain): a wind tunnel experiment" *by* Carlos Asensio et al.

Anonymous Referee #1

Is a good paper, with original results. My suggestions are that include in the results and in the discussion some comparison between the soils with crust and the ones that are in the manuscript related to the soils after tillage. Also to mention if the Olive Plantation and the cover crop are under irrigation or are rain fed. Also more detail in the interpretation of the statistical analysis
