

Supplementary data

Table S1. Results from the continuous extraction. From left to right: Pit codes (Fig. 1) and depth, AlkExSi fractions obtained ordered by Si/Al ratio ($\text{Si/Al} > 5$ and $\text{Si/Al} < 5$). The amount of AlkExSi (AlkExSi, mg g^{-1} of sample), the reactivity (k , min^{-1}) and the Si/Al ratio (Si/Al) are shown for biogenic and non-biogenic fractions (see Eq. (1)). Missing values indicate the absence of additional fractions according to the curve model.

Table S4. Granulometry (Average % (SD) of total texture) and mineralogy content (% of total minerals) for the different positions along the slope. For the mineralogy analysis only samples at 20-30 and 55-65 depths were analyzed. ¹Sample CGBR3_5565 was not analyzed due to the scarce of sample remaining. In the case of FG slope, instead of the bottom position, upper middle position was selected in order to avoid repeatability with the bottom of FS. Matrix consists on a mixture of sanidine, goethite, hematite, gibbsite, smectite, vermiculite and illite. *Values below 5% might not be reliable due to the limitations of the quantifying method.

			Granulometry			Mineralogy*				
			% loam	% sand	% clay	% quartz	% cristobalite	% halloysite	% kaolinite	% matrix
