Interactive comment on "The effect of municipal wastewater on soil chemical properties" *by* Mohsen Irandoust and Ali Salehi Tabriz

Anonymous Referee #2

The subject is interesting because many countries opt for treated wastewater reuse in agriculture due to water shortage. Soil is complex and heterogeneous which make it hard to evaluate the effect of these effluents with low quality. The poor english made it hard to understand what the authors mean; it really need to be revised by a native speaker. I would be glad to re-evaluate it after revising the english. Some remarks are provided with the PDF file, for the results and discussions section, it was really hard to follow.
