I read with interest the work from von Specht and co-authors. I think the authors have done a thorough work and that their inclusions of finite source modelling and demonstration that it affects the landslide pattern and locations will be inspiring to analyze and reanalyze landslide patterns from earthquakes.

After reading the paper carefully I have listed a number of suggestion that may bring small clarifications and some additional relevant information that the author may want to include the manuscript. These comments are listed in the supplementary file.
