Received and published: 16 November 2018

This is very interesting paper based on results of interpretation of relatively dense coverage of seismic data from N Israel. It sheds new light on the last stages of development of one of the key structural features of the Arabian plate, i.e. the Irbid rift. Before its publication however it requires some modifications and clarifications, in particular certain features shown on interpreted seismic profiles need to be more precisely described and justified. All my detailed comments are included in the attached pdf file.
