Received and published: 29 October 2019

This paper presents a study of the soil-landscape relationship after sandstone-gneiss topolithosis in Amazonas, Brazil. The introduction highlighted soil formation in the Amazonian areas. Although well written, it may be necessary to highlight the problem of mapping soil distribution and the relationship with parent material. Present and reinforce what's new with this work. Material and Methods are well written. Is necessary revised C values and rediscuss C and OM data. Conclusions can be more deepened.
