Received and published: 18 April 2019

We thank the reviewer for the comment.

The review mainly follows the line of arguments by reviewer #1, so we think most of the concerns (the interpretation section) are already addressed there. We tried to better explain the apparent differences of seismic and well log velocities by taking into account the large distance between the two sites (5 km) and a possible different properties of the alluvium / fanlomerate cover. We also provide an updated Fig. 11.
