I agree with the summary of Prof Bleibinhaus.

The part of the paper that needs revision is the interpretation section. To me the results seem to be somewhat 'overinterpreted'. I would prefer it if this section gets shortened. The most speculative parts should be removed completely. This concerns mainly the interpretation of the resulting V_p/V_s ratio section. I find that the interpretation lacks factual evidence. Further, in Fig 11 the velocities obtained from the processing of the

active and passive seismic data are depicted next to a sonic log from a nearby well. There is a very significant difference between the seismic velocities and the sonic log velocities. This needs to be addressed in more detail.
