

Response to reviews on the MS: **“Evolution of the Iberian Massif as deduced from its crustal thickness and geometry of a mid-crustal (Conrad) discontinuity”**, by Ayarza et al.

Reviewer 1 and editor

Dear editor,

Suggested revisions have been carried out. The Geological Setting has been shortened and organized in subsections. Non relevant parts of the text have been removed. The Discussion has been also slightly shortened and also some parts have been divided in subsections. Finally, English Grammar has been further revised throughout the text and the paper has been accordingly edited.

We understand this is a long paper, probably complex for those not familiar with the Iberian Massif, as it presents a compendium and re-interpretation of all normal incidence seismic datasets. However, we consider it very appropriated for this special volume and we are happy to include it there.

Best regards
