Scientific significance: The manuscript represents a substantial contribution in the description of a granitic reservoir using GPR and seismic methods. The comparison of measured GPR data with known geology leads to enhancement in site description. The seismic tomography between boreholes identifies anisotropy, shear zones and

fractures in the rock.

Scientific quality: The scientific approach and applied methods are adapted to the scientific problem. The results are discussed in an appropriate and balanced way. Related work was considered, including appropriate references.

Presentation quality: The scientific results and conclusions are presented in a clear, concise and well-structured way with appropriate use of the English language.

Does the paper address relevant scientific questions within the scope of SE? yes

Does the paper present novel concepts, ideas, tools, or data? yes

Are substantial conclusions reached? yes

Are the scientific methods and assumptions valid and clearly outlined? yes

Are the results sufficient to support the interpretations and conclusions? yes

Is the description of experiments and calculations sufficiently complete and precise to allow their reproduction by fellow scientists (traceability of results)? yes

Do the authors give proper credit to related work and clearly indicate their own new/original contribution? yes

Does the title clearly reflect the contents of the paper? yes

Does the abstract provide a concise and complete summary? yes

Is the overall presentation well structured and clear? yes

Is the language fluent and precise? yes

Are mathematical formulae, symbols, abbreviations, and units correctly defined and used? yes

Should any parts of the paper (text, formulae, figures, tables) be clarified, reduced, combined, or eliminated? some figures should be clarified

Are the number and quality of references appropriate? yes

Is the amount and quality of supplementary material appropriate? yes
